1. Campus Service Directory Using Spring Boot and MySQL

To develop a client-server web application using Spring Boot and MySQL to search campus services and manage service requests.

Requirements:

1. Client: Search for campus services such as computer repair, electrical maintenance, transport, hostel maintenance, and stationery shops.
2. Server: Retrieve and display the responsible person's name, contact details, availability, and working hours from the database.
3. Client: Submit service requests by providing the requester's name, service category, location, and problem description.
4. Server: Store service requests in MySQL, generate a unique request ID, and maintain request status as Pending, In Progress, or Resolved.
5. Implement REST APIs using Spring Boot for searching services, submitting requests, and updating request status.
